1     ABSTRACT OF THE DISCLOSURE

          A semiconductor device which allows an input  
signal thereto to select one of N operation modes, and  
operates in the one of N operation modes includes a  
5     selection circuit for selecting an operation mode from  
the N operation modes when the input signal indicates  
the operation mode, and for selecting a predetermined  
operation mode from the N operation modes when the  
input signal is an undefined signal indicating none of  
10    the N operation modes. The semiconductor device  
further includes an internal circuit operating in an  
operation mode selected by the selection circuit.
